— What we've done for the Student —
Peer Review App

Introduction to Our Project

Hello, all! Like all of you, we've been working on the peer review application website over the past 7 weeks. It's been an unforgettable experience. There's been a fair share of tribulations, and we've all improved our skills and experience over the course of this project. We've spent a long time on this project, so we're excited to show it to you.

Developer C

Kanban / Workflow

To manage our project, we used Kanban to keep track of the status of various user stories' progress while communicating and coordinating regularly on discord. We used github for version control and working on individual feature branches and as a precaution we has two other developers review the pull request before completing the merge to the development branch.

Our project is built primarily upon the 'main' branch provided by the instructor/client to serve as a baseline.

Project Work Schedule

	Monday	Tuesday	Wednesday	Thursday	Friday
Odd Week	Daily Scrum 2:30 - 3:45	Group Meeting 1:00 - 2:00	No Meetings	Bi-weekly Meeting 11:00 - 11:30	Daily Scrum 2:30 - 3:45
Even Week	Daily Scrum 2:30 - 3:45	Group Meeting 1:00 - 2:00	No Meetings		Daily Scrum 2:30 - 3:45

How we organized ourselves

Our organization is flexible, incorporating both meeting, regular discord communication and a review process for completed user stories. This allows us to both be flexible and establish expectations to get results delivered.

Start of the project (Weeks 5-7)

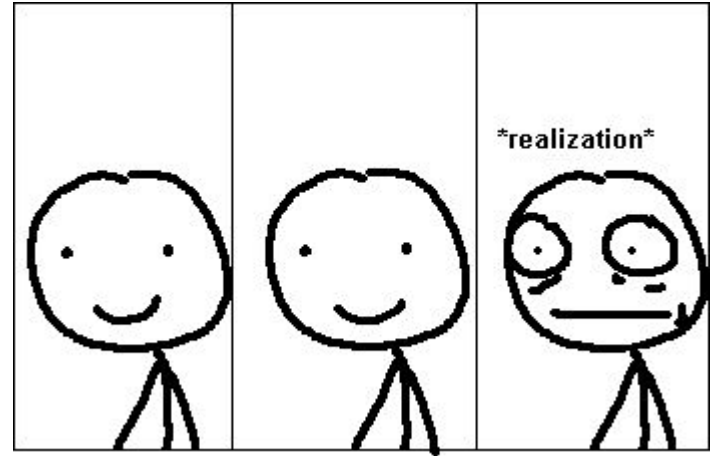

The first few weeks started off relatively slow, with us still coming off the practice project. A collaboration document was created, and fairly quickly Jun and Sully took up the first two user stories (US9 and 11) and Kenji took US14. Rylan finished out by choosing US19, which turned out to already be implemented. Kenji created our Kanban board early in February, letting us track our progress on user stories more effectively.

End of the project (8-Now)

Late in february, Rylan became more and more of a 'documentation monkey', completing a lot of the group evals and the misc. Java labs solo to let the team work more on completing user stories, which might have sabotaged his ability to complete user stories effectively.

(Add more later plz.)

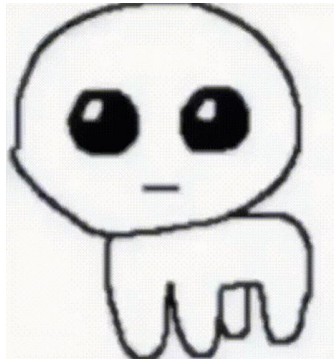

PRESENTATION! (Our project/code in action)

Successes

- We managed to get a frankly impressive number of user stories done and implemented well
- Our organization let us frequently submit lab assignments ahead of schedule.
- By communicating on discord, we avoided doing more work than was necessary and collaborated better, leaning on each of our individual strengths.

What to improve for next time.

- More balanced duty distribution that are more in line with the intended proceedings of the project
-
